

Managed Artificial Intelligence Archetype

M.A.I.A. manages our two data science solutions DAVE and LUCI.

Data Analytics Visualisation Engine (DAVE)

Within DAVE, a user can configure DataSet that are designed to receive or send data from multiple data sources like:

API

Device IoT

XGRC Data

Microsoft
Graph

Microsoft
Power Apps

Microsoft
PowerBi

Custom
Requirements

Live User Control Interface (LUCI)

DataViews

DataViews allows a user to create a view using any number of DataSets, machine learning and neuralnets. This provides the user with the ability to expose the DataViews via API to Business Inelegance (BI) tools or use the dashboards created in M.A.I.A.

Agents

Agents provide the ability to truly use the power of Artificial Intelligence (AI). Businesses can use the data to do a range of tasks that would normally require human intervention.

Why M.A.I.A. is good for business

- State-of-the-art business intelligence platform that facilitates enterprise risk profile management
- Automation in all aspects of the solution – from real-time system integration to the dissemination of derived analytical results
- Controlled and managed by AI engine acting as in-system assistant to users
- Highly adaptive and aggressive business rule engine that empowers users with real-time operational decision-making
- Supports multiple interface methodologies .
